Staff Platform Engineer — Cloud Infrastructure

Northstar Wallet · Singapore (hybrid) · Full time

Fictional job posting for the AnyView demo.

About the team

Northstar Wallet runs a consumer payments app used by 6 million people across Southeast Asia. The Platform team of eight builds the cloud foundation that 20 product teams ship on: Kubernetes clusters, infrastructure as code, CI/CD and observability.

What you'll do

- Lead the design of our next-generation platform on Google Cloud, from network to developer experience.
- Own platform reliability: set SLOs, lead incident response and run blameless postmortems.
- Build self-service golden paths so product teams can ship a new service without a ticket.
- Bring down cloud spend without slowing teams down.
- Mentor engineers and help grow the Platform team from eight to twelve.
- Work with Security, Risk and Compliance to keep us inside payments regulation while still shipping weekly.

What we're looking for

- 7+ years in platform, SRE or DevOps roles, with production ownership of a regulated or high-traffic system.
- Deep, hands-on Kubernetes and Terraform.
- Experience leading a large migration to the cloud.
- Clear writing and the ability to push back on a deadline with data rather than opinion.
- Experience hiring and mentoring engineers.

Nice to have

- Payments or fintech background.
- Google Cloud Professional Cloud Architect or CKA certification.
- Experience with streaming systems.
