Senior Cloud Solutions Architect — Multi-Cloud

Northstar Cloud Partners · Singapore (hybrid) · Full time

Fictional job posting for the AnyView demo.

About the team

Northstar Cloud Partners is a cloud consultancy serving banks, insurers and public-sector agencies across Southeast Asia. Our Architecture practice of twelve designs and delivers secure landing zones, platform modernisation and AI-assisted operations on AWS, Google Cloud and Microsoft Azure, and stays with each customer from the first workshop to run-state support.

What you'll do

• Lead discovery with customer stakeholders, turn their requirements into a scope of work, and produce effort estimates that hold up in delivery.

• Design multi-cloud architectures (landing zones, networking, identity and security controls) that meet regulatory and compliance requirements.

• Lead delivery hands-on: write and review Terraform, set up keyless CI/CD, and troubleshoot what other teams cannot.

• Shape new business: run assessments, contribute to RFP responses and present solutions to customer leadership.

• Build reusable assets for the practice: reference architectures, golden templates and assessment frameworks.

• Bring generative AI into our offerings responsibly, from retrieval-augmented assistants to automated compliance checks.

• Mentor consultants and help grow the practice.

What we're looking for

• 5+ years in cloud architecture or infrastructure consulting, with customer-facing ownership of engagements end to end.

• Deep, hands-on experience on AWS and at least one of Google Cloud or Microsoft Azure.

• Infrastructure as code with Terraform, and CI/CD without long-lived credentials.

• Experience in regulated or public-sector environments (for example IM8, MAS TRM or CIS Benchmarks).

• Clear communication with both engineers and executives, including pushing back on scope or deadlines with evidence.

• Experience mentoring or leading engineers.

Nice to have

• AWS Certified Solutions Architect – Professional, or Google Cloud Professional Cloud Architect.

• Kubernetes in production (Amazon EKS or GKE).

• Hands-on generative AI on a cloud platform (Amazon Bedrock or Gemini Enterprise Agent Platform).

• FinOps or cloud cost optimisation experience.
