Cloud Architect · Singapore · mike.rose@example.com · +65 8000 1234 · linkedin.com/in/mike-rose-demo

Demo candidate for AnyView. Name and contact details are fictional.

SUMMARY

Cloud Solutions Architect with 5+ years in technology consulting, leading cloud architecture engagements with customers across AWS, Google Cloud and Microsoft Azure. I own engagements end to end, from requirements, scope and effort estimation through delivery, operations handover and L3 support, and I often step into the gap when a team shrinks or a skill is missing. Outside work I build and run my own apps on AWS and Google Cloud, all in Terraform with keyless CI/CD.

SKILLS

- Cloud platforms: Amazon Web Services (AWS), Google Cloud, Microsoft Azure
- Containers and delivery: Amazon EKS, Helm, Docker, GitLab CI/CD, GitHub Actions
- Infrastructure as code: Terraform, AWS CloudFormation
- Security and identity: AWS IAM Identity Center, Okta, AWS Shield Advanced, CIS Benchmarks
- AI: Amazon Bedrock, Retrieval-Augmented Generation (RAG), Vertex AI, Gemini, Claude
- Data: Databricks, Amazon QuickSight, Amazon Managed Grafana, MariaDB, MaxScale, Amazon DynamoDB, Firestore
- Serverless and messaging: AWS Lambda, Amazon SQS, Amazon API Gateway, AWS Step Functions, Cloud Run
- Programming and scripting: Python, TypeScript, JavaScript, Bash
- Practices: AWS Well-Architected Framework, landing zone design, pre-sales solutioning, effort estimation

CERTIFICATIONS

- AWS Certified Machine Learning – Specialty — Amazon Web Services, Mar 2026
- AWS Certified Machine Learning Engineer – Associate — Amazon Web Services, Mar 2026
- AWS Certified AI Practitioner — Amazon Web Services, Mar 2026
- Oracle Cloud Infrastructure Certified Architect Associate — Oracle, Mar 2026
- AWS Certified Data Engineer – Associate — Amazon Web Services, Feb 2026
- AWS Certified Advanced Networking – Specialty — Amazon Web Services, Jan 2026
- AWS Certified Cloud Practitioner — Amazon Web Services, Jan 2026
- AWS Certified DevOps Engineer – Professional — Amazon Web Services, Dec 2025
- AWS Certified Developer – Associate — Amazon Web Services, Dec 2025
- AWS Certified CloudOps Engineer – Associate — Amazon Web Services, Dec 2025
- AWS Certified Security – Specialty — Amazon Web Services, Nov 2025
- AWS Certified Solutions Architect – Professional — Amazon Web Services, Jun 2025
- AWS Certified Solutions Architect – Associate — Amazon Web Services, Jan 2023
- Microsoft Certified: Azure Fundamentals (AZ-900) — Microsoft, Jan 2023

EXPERIENCE

Founder and Builder — AnyApps

Aug 2026 – Present · Singapore

Responsibilities

- Design, build and run a family of AI-assisted web apps and bots on AWS and Google Cloud as a one-person team.
- Provision everything in Terraform and deploy through keyless CI/CD: GitHub Actions with OIDC on AWS and Workload Identity Federation on Google Cloud, with no long-lived cloud keys.

Projects

- AnyView interview coach: job-seekers had no way to practise interviews against their own real experience. I built a web app that turns a resume into a user-confirmed knowledge base and runs spoken mock interviews scored against a rubric. The backend is Python (FastAPI) on Cloud Run with Cloud SQL for PostgreSQL and pgvector, Gemini on Vertex AI (including Gemini Live for voice), Cloud Tasks and Firebase Hosting. Result: 238 commits and 44 architecture decision records in one month, built for the AI Builder Cup.
- AnySplit bill-splitting bot: splitting a restaurant bill by hand is slow and error-prone. I built a Telegram bot and Mini App that reads a receipt photo with Claude vision into line items, lets the payer assign items to people, and returns exact per-person totals with service charge and GST folded in. It is written in TypeScript and runs on AWS Lambda, Amazon API Gateway, Amazon SQS and Amazon DynamoDB, with the Mini App in React on S3 and CloudFront. Result: live and public, handling SGD, JPY, MYR, USD and other currencies, with every share summing exactly to the amount paid.
- AnyTatt tattoo placement studio: people could not see how a tattoo would sit on their own arm before committing. I built a browser studio in JavaScript and Three.js that models the user's arm and hand from seven tape measurements, extracts ink from a photo on the device, and places artwork in centimetres. The backend is Node.js on Cloud Run with Firestore, Identity Platform and metered Vertex AI image generation. Result: launched publicly at anytatt.anyapps.cloud, with arm girth held within 0.1% by a 41-test regression suite and cold-visit transfer cut from about 750 kB to 249 kB.
- AnyIssues capture bot: ideas for my apps were getting lost between chat and GitHub. I built a Telegram bot that turns a raw note into a GitHub issue with acceptance criteria and sends a daily digest of open work. It is dependency-free Python on AWS Lambda with Amazon SQS, Amazon DynamoDB and EventBridge Scheduler. Result: a double tap files exactly one issue, and failed model calls retry up to three times before a dead-letter queue.

Key moments

- When the interview report took eight minutes (Oct 2026): one AnyView report took over eight minutes to appear. I read the usage and Cloud Run logs and found the preview Gemini Pro model throttling: the report fires ten calls at once, 13 requests hit 429 errors in the first 12 seconds, and one stuck call could keep retrying for up to eight minutes. I made the report's calls fail fast after 75 seconds and two attempts, then fall back once to Gemini Flash at low effort, which I measured at 5 to 10 seconds on the real scoring prompt. Result: the worst-case report time went from over eight minutes to about three and a half.
- A currency bug I shipped to production (Sep 2026): I merged and deployed multi-currency support for AnySplit, and a code review I ran afterwards found two data-corruption bugs in it. A Japanese yen price typed as "3,270" was saved as 3, and a client could store an invalid currency code that broke every later display of that bill. I fixed both the same day, verified them against the exact reproductions and all 9 test receipts, and closed the review's 7 remaining findings in follow-up changes. Result: every test receipt still reconciled exactly, and the fixes shipped within a day of the bugs being found.
- Measuring before building (Sep 2026): before committing to a design for AnySplit, I tested Claude models on 9 real phone photos of receipts. Sonnet reconciled 6 of 9 raw photos and 8 of 9 cropped ones, against 3 and 5 for Haiku, and straightening the photos made no difference. Result: I built cropping into the pipeline and left deskewing out, because cropping mattered more than the choice of model.

Multi-Cloud Solutions Architect — Lenovo PCCW Solutions

Apr 2026 – Present · Singapore · Band 8 (of 10)

Responsibilities

- Gather and refine customer requirements, define scope of work (SOW), and produce effort estimates and bills of quantity (BQ) for new engagements and change requests.
- Design multi-cloud solution architectures that meet customer, security and compliance requirements.

- Build service offerings and internal IP the team can reuse across customers: golden templates, a central knowledge base and best practices.
- Shape business opportunities by running assessments, building relationships and growing accounts, as a trusted advisor on customer roadmaps.
- Act as the L3 engineer on delivery, troubleshooting issues L1 and L2 cannot resolve.
- Build team capability through hiring, interviewing, mentoring and knowledge sharing.

Projects

- AI-powered multi-cloud assessment solution: native cloud tools give siloed findings that need expertise to interpret, and customers had no single, standards-aligned view of their AWS and Azure environments. I architected a platform where read-only collectors gather inventory, deterministic rules evaluate 664 compliance rules across 8 pillars built on the AWS Well-Architected Framework, and Amazon Bedrock with a custom RAG pipeline writes resource-level remediation guidance. It runs on AWS Step Functions, AWS Lambda in Python and Aurora Serverless PostgreSQL with pgvector. Result: one prioritised, audit-ready set of findings mapped to CIS, AWS Trusted Advisor and IM8, with nothing left running in the customer's environment and no credential exchange.
- Multi-cloud Databricks platform: a public-sector client needed Databricks across its existing Azure estate and AWS, inside a government cloud platform's centrally managed networking and security standards. I designed the target architecture, separating the vendor-managed control plane from compute injected into the client's own networks, with single sign-on and private, firewalled connectivity across both clouds through AWS Transit Gateway and Azure Virtual WAN. Result: a defensible target architecture with the approvals each cross-cloud connection needed, giving a clear basis for scoping and delivery.
- Scoping and effort estimation framework: change requests were estimated with flat, top-down figures that missed real effort such as state reconciliation and hypercare. I built complexity-tiered estimation models that tie man-days and FTE to actual resource counts across the full lifecycle. Result: the model covers 8 resource types and reconciles exactly to target estimates, re-sized support for a roughly 5x larger managed inventory after migration, and extended estimates from servers to serverless and other cloud resources.
- Containerised file-transfer platform modernisation: a government client's managed file-transfer platform on Kubernetes was deployed by hand, with Terraform state held locally and long-lived cloud credentials. I split the codebase into infrastructure, Kubernetes and Docker container layers, moved Terraform state to a central backend with zero drift, set up keyless OIDC from GitLab CI/CD to AWS with branch-scoped roles, and ran day-2 Amazon EKS operations with Helm upgrades, rollbacks and IRSA. Result: a pipeline-driven deployment model with short-lived CI credentials and repeatable changes across UAT and production.

Key moments

- Winning over a new client group in person (2026): it was my first session with a new group of stakeholders at a client, on a design exercise for the Databricks platform, and I needed to build credibility quickly. I arranged a face-to-face session instead of a call, prepared a thorough walkthrough of the design, and answered every technical question on the spot. Result: the client told a colleague the presentation was a clear step up from earlier sessions with other teams, and it established trust with the new group.
- Getting other architects to assess the same way (2026): each architect assessed their own clients with no common method, so findings varied with who ran the engagement. I designed a two-part model: a discovery workshop across 8 domains the automated scan cannot see, such as operating model and governance, paired with the 664-rule assessment platform, on a common maturity scale with a fixed findings template. Result: fellow architects adopted the framework and templates for their own client assessments instead of starting from scratch each time.

Cloud Architect / Infrastructure Transformation Specialist — Accenture

Jul 2021 – Mar 2026 · Singapore

Responsibilities

- Advised enterprise customers and architected secure multi-cloud landing zones on AWS and Google Cloud, covering networking, identity, DevSecOps, centralised logging and security governance.
- Contributed to RFQ and pre-sales engagements: solutioning, effort estimation, scope definition, oral presentations and proof-of-concept builds.
- Hardened cloud platforms to CIS Benchmarks and deployed AWS-native security services for threat and DDoS detection and compliance monitoring.
- From 2021 to 2022, worked as a business and functional analyst on public-sector delivery projects, gathering requirements and designing APIs and batch programs.

Projects

- AWS landing zone multi-workstream enhancement: after the landing zone contract was renewed, the client needed six enhancement workstreams (identity, security, observability, cost management, DevOps and ITSM) delivered alongside ongoing operations. I led delivery as both Service Delivery Manager and hands-on cloud engineer, owning client governance, plans and risks, and building the security enhancements myself, including AWS Shield Advanced protection in Terraform. Result: all six workstreams delivered while coordinating an offshore operations team of 10+ across 3 teams.
- Google Cloud landing zone build: the client was extending its estate to Google Cloud and the offshore resources planned for the build were offboarded. I led the design and built the networking, IAM, organisation policies, logging and monitoring myself in Terraform. Result: a working Google Cloud landing zone with 10 projects and more than 40 policies, and I became the only onshore architect with hands-on Google Cloud experience on the account.
- DevSecOps platform operations and automation: deployments across many AWS accounts were manual and drifted between environments. I designed the GitLab CI/CD and AWS DevSecOps delivery model and automated provisioning with AWS CloudFormation, Terraform and Bash, including AMI build pipelines and large-scale stack updates. Result: deployment cycle time cut from one week to one day, an 80% reduction, with changes rolled out across 100+ CloudFormation stacks and 10+ AWS accounts.
- SSO and access governance integration: users reached AWS through individually managed IAM users with separate credentials per application. I integrated AWS IAM Identity Center with Okta over SAML, migrated users off IAM users, and onboarded the PAM and VPN tools and the Amazon Managed Grafana and Amazon QuickSight dashboards onto single sign-on. Result: 300+ users migrated and 4 applications on one login under central, policy-based control.
- Government ITSM platform on AWS: a government client needed its IT service management solution on the cloud to meet its business and security requirements. I led the architecture and deployment of ServiceNow on Amazon EC2, Amazon VPC and Elastic Load Balancing, with a highly available MariaDB cluster behind MaxScale and backup and restore strategies. Result: the platform met its compliance requirements and went live on 8 July 2024.
- Report rationalisation for a luxury retail data programme: the client's data leadership had to decide which of 150+ business reports to migrate, enhance or retire before their platform was decommissioned. As business analyst from June to August 2025, I mapped who used each report, from C-level to working level, and grouped reports into use cases with a Python method that compared their data fields. I also automated tailored messages to 300+ report users with Power Automate. Result: the gap analysis, user lists and findings summary were delivered on time for the leadership team's decisions.
- Internal engagement programme analytics: an internal employee-engagement programme had no structured way to measure its return on investment. I designed the survey and response frameworks and proposed initiatives to raise participation. Result: the organisers gained a basis for measuring the programme with more data points.

Key moments

- Taking over six workstreams after the team shrank: I was Service Delivery Manager on the landing zone renewal and was not meant to do the hands-on work for all six workstreams. When team members were offboarded, I studied each workstream, assessed what was left and took over its build and maintenance, while still running client meetings, plans and risk tracking. Result: all six workstreams kept running and delivered without disruption.

- Becoming the DDoS-protection expert when vendor support ran thin: the client needed AWS Shield Advanced on critical public-facing workloads, and even AWS Support could offer little help. I learned the service in depth, designed and customised the protection in Terraform, and built it myself. Result: the implementation was delivered and I became the team's subject-matter expert on Shield Advanced.
- Sole architect and engineer on a Google Cloud build: Google Cloud was new to me when the offshore team planned for the landing zone was offboarded. I took both roles, learned the platform as I went, led the design discussions and built the foundation myself. Result: the landing zone was delivered with close to zero issues, and I became the only person on the project with hands-on Google Cloud architecture experience.
- Moving from delivery into pre-sales: when the landing zone contract came up for renewal through an RFP, I was asked to deliver the oral presentation to client management, unusual at my level. I contributed to the solution, built the presentation and presented it, drawing on my knowledge of the client's environment. Result: the renewal was awarded, and I went on to work on 3 RFPs and stand in as Service Delivery Manager for a new tender.
- Challenging the database specialist's configuration (2024): on the government ITSM project, I took on MariaDB setup and operations although I was a cloud infrastructure engineer. While learning MariaDB clustering and MaxScale disaster recovery, I found errors in the configuration made by the in-house MariaDB specialist, the person the team treated as the authority, and corrected them rather than build on a setup I knew was wrong. Result: I became the team's go-to person for MariaDB, and the platform met its compliance requirements to go live on 8 July 2024.
- Taking over a track mid-project (2024): partway through the government ITSM project, I took over the technical-architecture track from another lead, running the workshops and the discussions with the client's technical and enterprise architects. Result: I ran the whole track on my own through go-live and handled the technical go-live issues under time pressure.
- Leading by expertise, not tenure: my team took over a DevSecOps platform spanning 10+ AWS accounts and 100+ CloudFormation stacks from another company with very little handover, and I was made lead over teammates with more years of experience. When pipelines failed and no one could find the cause, I read through the previous team's pipeline and infrastructure code and traced problems to root causes from AMI lifecycle to domain-join failures. Result: I became the team's go-to for critical issues and kept operations running reliably after the handover.
- Juggling two client projects at once: I worked on a government migration with two streams and a landing zone with six workstreams, and their peaks often landed together. I prioritised by urgency, delegated to the right teammates and trusted them to cover streams, and kept stakeholders updated throughout. Result: both projects stayed on track while I kept leading technical workshops.
- Hosting a client delegation abroad: my client held an annual study trip for its delegates to visit companies in Sydney. I planned the schedule and logistics end to end and hosted the delegates throughout. Result: 9 client delegates visited 8 companies over 4 days, with positive feedback from every participant.

EDUCATION

- Fleximasters in Business and Financial Analytics — Nanyang Technological University, Feb 2022 – Sep 2022
- Bachelor of Science (Honours) in Mathematical Sciences, Statistics — Nanyang Technological University, Aug 2017 – Apr 2021
